LAB ASSIGNMENT - 10
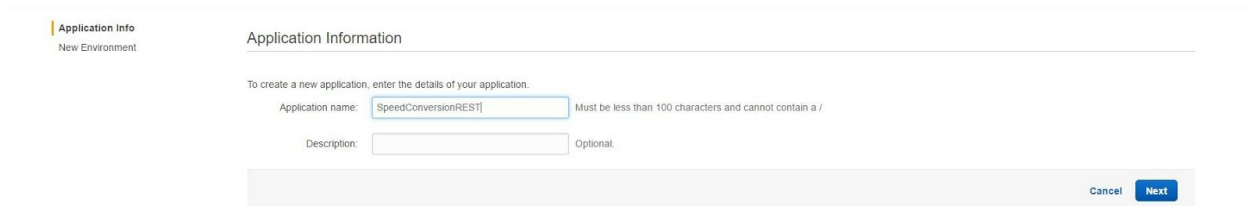

-> After Creating an Account in Amazon WebServices and setting up the Environment, create a new application.

-> Before deploying open the source in the eclipse and export the project as a war file
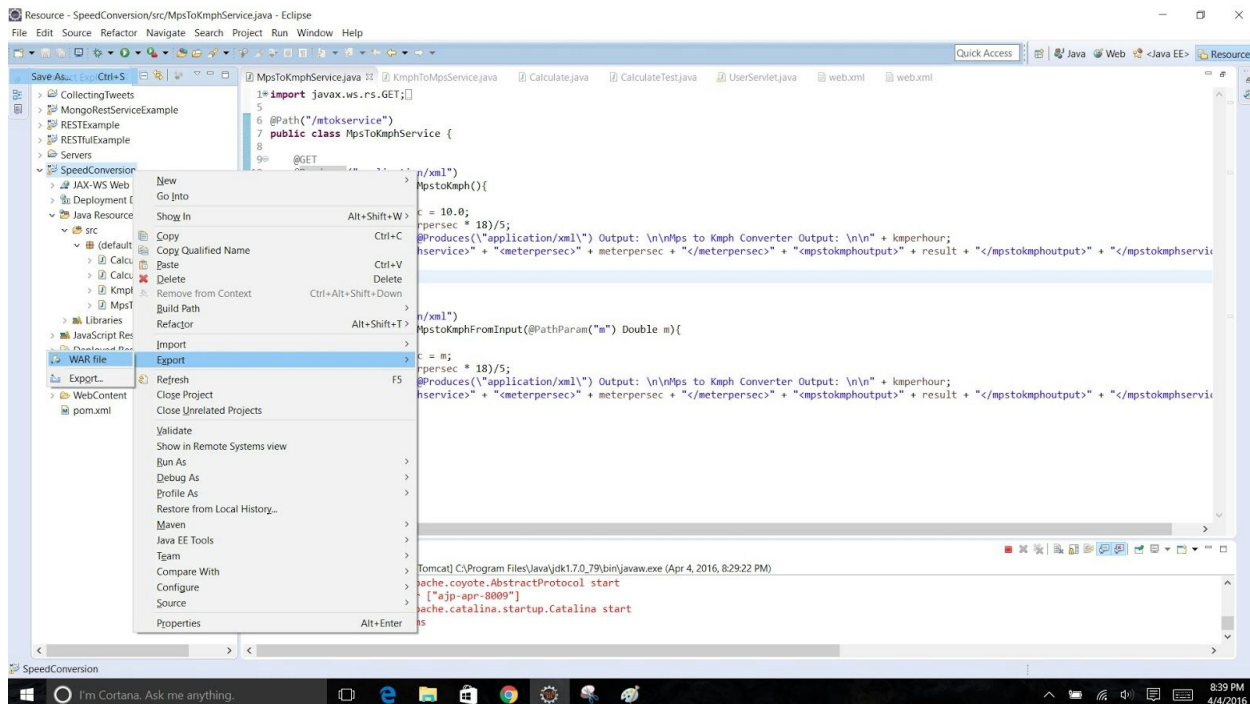

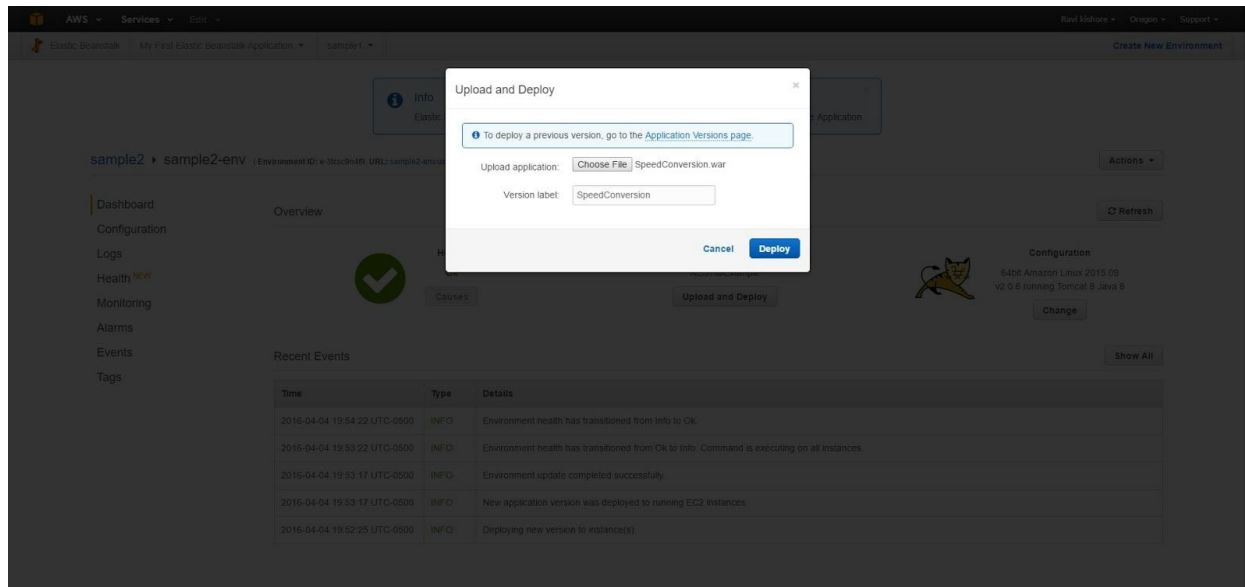

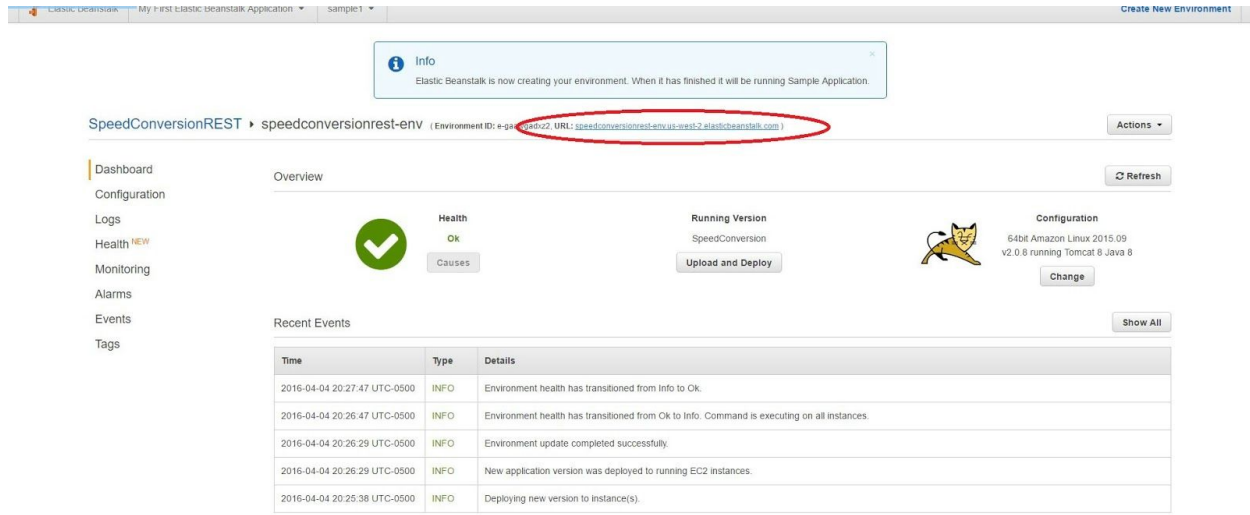

-> Now click on the upload and deploy button after creating the application, select the war file that is exported in the above step

-> Click on the deploy and a URL is generated for the application

-> Copy that URL, attach the url pattern assigned to the service in the project and then run it in the browser

-> The URL of the amazon web service of the above application is

http://speedconversionrest-env.us-west-2.elasticbeanstalk.com

-> The URL including the url pattern of the application is

http://speedconversionrest-env.us-west-2.elasticbeanstalk.com/speedconversion/mtokservice
